

TrustLayer

Updated 3-Minute Hackathon Pitch Script

VIKSIT BHARAT IDEATHON 2026 • Cyber Safety • Team Biryani

0:00-0:22	Slide 1 • Team & Idea
0:22-0:52	Slide 2 • Problem
0:52-1:35	Slide 3 • Proposed Solution
1:35-2:00	Slide 4 • Key Features
2:00-2:28	Slide 5 • Technology & Implementation
2:28-3:00	Slide 6 • Impact & Future Scope

Slide 1 • Team & Idea

0:00-0:22

Good morning judges. We are Team Biryani, and our project is TrustLayer, under the Cyber Safety theme.

Today, an image, video, voice clip, or screenshot can be generated or manipulated in seconds. But the bigger problem is simple: how do we know what we see can be trusted?

TrustLayer is a multi-layer digital media verification platform that examines content and explains the evidence behind its assessment.

Delivery cue: Emphasize the final question.

Slide 2 • Problem

0:22-0:52

People encounter AI-generated images, manipulated videos, fake screenshots and misleading posts every day.

Sophisticated manipulation is difficult for an average user to identify, while verification tools are often fragmented and technical.

This creates real risks: scams, reputational damage, and erosion of trust in digital media.

Our problem is: how can we make media verification simple enough for ordinary users while still showing meaningful evidence?

Delivery cue: Keep this fast and factual.

Slide 3 • Proposed Solution

0:52-1:35

Our answer is TrustLayer.

Instead of relying on one detector and returning only “real” or “fake”, TrustLayer combines multiple signals: AI-generation detection, manipulation analysis, provenance or source information, and file-level evidence.

The workflow is simple: submit media → analyze multiple signals → review the findings → receive an evidence-based assessment.

The key difference is that we do not want to give users only a label. We want to give them a reason.

If several signals raise concern, the system can show that the content requires review and explain why.

Our principle is: Don't just detect. Explain the evidence.

Delivery cue: Core slide. Pause after “We want to give them a reason.”

Slide 4 • Key Features

1:35-2:00

TrustLayer turns that approach into a practical user experience.

It can check for AI-generated content, identify potential media manipulation, examine source and provenance information, and work with content people encounter online, including images, videos and screenshots.

The technical analysis becomes a clear assessment with a short explanation, so users do not need forensic expertise to understand the result.

Delivery cue: Point to each feature as you name it.

Slide 5 • Technology & Implementation

2:00-2:28

Technically, TrustLayer is a modular web application.

The frontend handles submission and results. The backend orchestrates verification. The AI layer performs detection and analysis, while the data layer can store verification history and application data.

The architecture is modular, so individual detection components can be improved or replaced without rebuilding the platform.

That gives us a practical prototype today and a scalable path for future development.

Delivery cue: Focus on buildability, not implementation details.

Slide 6 • Impact & Future Scope

2:28-3:00

TrustLayer can support social-media users, students, journalists and fact-checkers, and small businesses when they encounter suspicious media.

The impact is faster initial verification, better awareness of digital manipulation, and safer decisions before sharing or acting on content.

Our future scope includes a browser extension, mobile apps, multilingual support, live video analysis and API integration.

But TrustLayer is not designed to decide what people should believe.

It gives them better evidence before they decide what to believe.

In a world where seeing is no longer enough to believe, TrustLayer helps you verify before you trust.

Thank you.

Delivery cue: Slow down for the final two sentences.

What Was Removed or Compressed

The important ideas were preserved. The cuts mainly remove repetition, long examples, and technical detail that does not help the judges understand the core idea within three minutes.

Slide 1

Shortened the list of fake-content examples. Kept the hook and product definition.

Slide 2

Removed repeated audience examples. Kept the three key risks and the core problem.

Slide 3

Removed the longer walkthrough and repeated explanation of single-detector limitations. Kept the multi-signal approach, evidence-based assessment, and main differentiator.

Slide 4

Merged individual feature explanations. Kept AI detection, manipulation, provenance/source checking, supported media, and explainable output.

Slide 5

Removed detailed layer-by-layer technical explanations. Kept frontend, backend, AI, data layer, modularity, and buildability.

Slide 6

Compressed beneficiary and roadmap descriptions. Kept the main beneficiaries, impact, future expansion, and closing vision.

5 Lines to Memorize

- **“How do we know what we see can be trusted?”**
- **“Verification tools are often fragmented and technical.”**

- **“TrustLayer combines multiple signals instead of relying on one detector.”**
- **“Don't just detect. Explain the evidence.”**
- **“TrustLayer helps you verify before you trust.”**

Target: approximately 2:50–3:05 at a clear, confident speaking pace.
